

Practical Procedure for Single Cam 3D Panorama Photography

In case of 28 mm eq. lens (Horizontal FOV=65.5 deg) 30 deg step of rotation θ gives enough overlap for stereo pair and the divergence keystone distortion is easily correctable by SPM.
 12 single cam shots could cover 360 deg 3D panorama. Actually as I use twin GH1, only 6 simultaneous shots is required. Stereo Base can be controlled by the off center rotation distance R.
